Hello, everyone. I'm from Zhejiang University of Science and Engineering.

The epidemic is not over yet and we still need to protect ourselves

So the plan of our team competition this time is to make an indoor intelligent disinfection system

Put the disinfectant spray in the designated position, and then let the robot execute the grab procedure

Indoor drawing was carried out to plan the walking route of the robot

So let's say this is a classroom and this is where we need to have our class. Just ask the machine to execute the automatic disinfection procedure, and the machine will automatically grab the disinfection spray and walk around the site, while the spray works to achieve the purpose of disinfection
